

Gensee Database Design Diagrams

Exported from docs/render_database_design.py.

Capture, Persistence, Retrieval

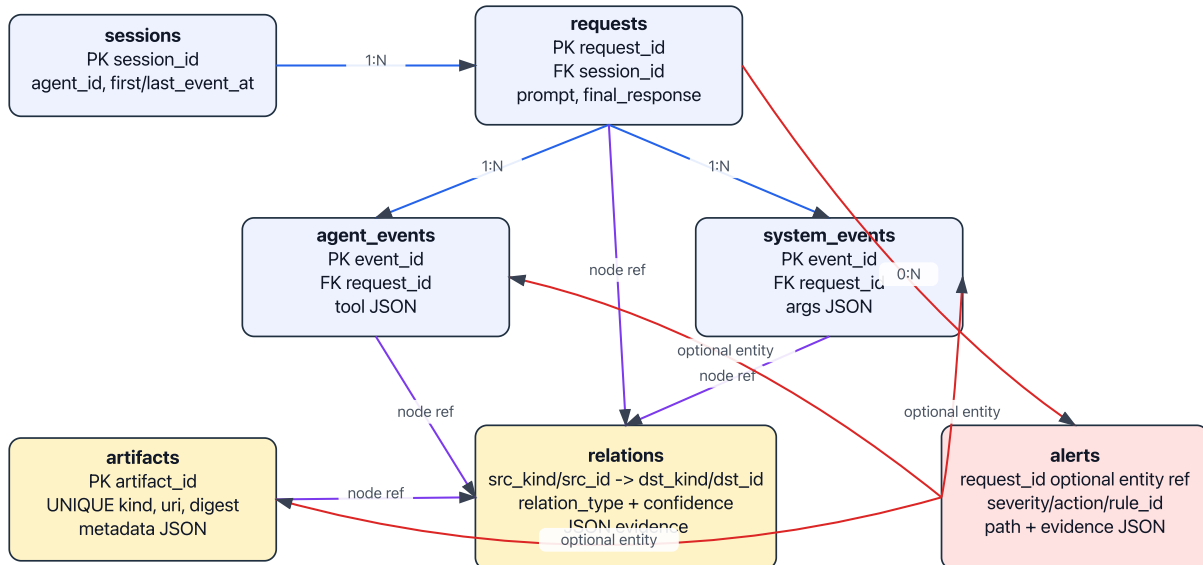

Gensee Database Design: Capture, Persistence, Retrieval

Tables and Relationships

Gensee Database Design: Tables and Relationships

Ownership is direct: sessions -> requests -> events. Relations are reserved for lineage and causality.

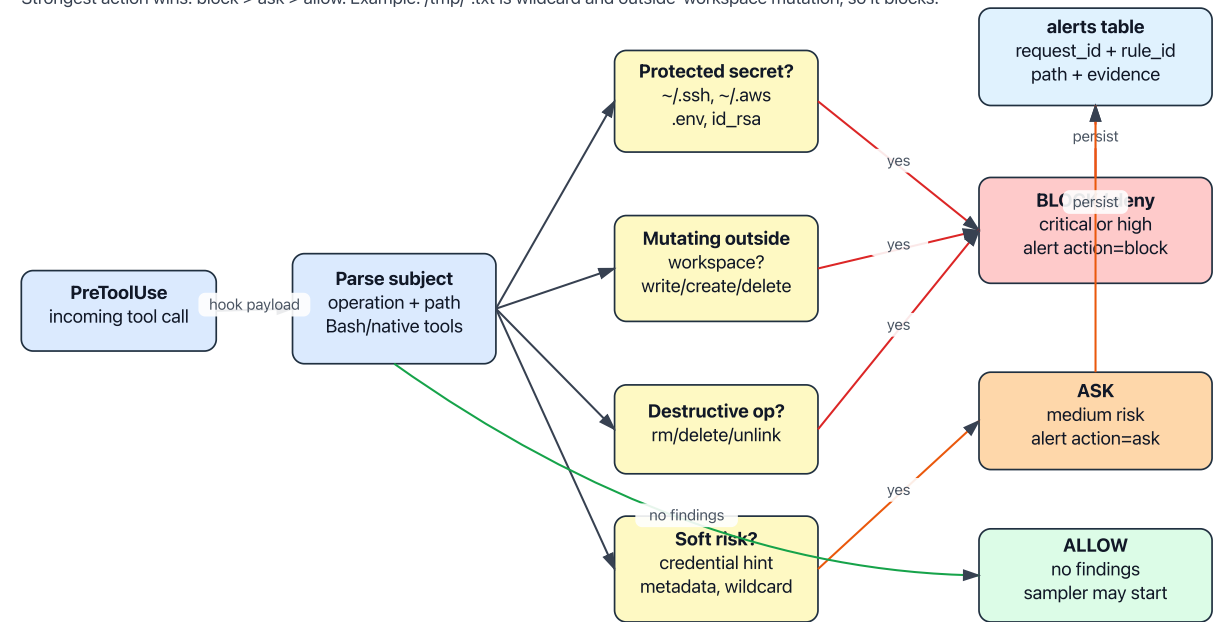

Known limit: artifacts usually dedupe by path today because digest is often empty, so content versions are not yet distinct.

Flagging and Enforcement

Gensee Database Design: Flagging and Enforcement

Strongest action wins: block > ask > allow. Example: /tmp/*.txt is wildcard and outside-workspace mutation, so it blocks.

Passive alerts without tool_use_id stay global in timeline; PreToolUse alerts attach under the matching tool call.
